1 Review Summary

1.1 Protocol Overview

This PR allows the swap verifier to use the deposit() function on vaults without a skim().

1.2 Audit Scope

This audit covers PR totaling approximately ~20 lines of code across 0.25 days of review.

```
evk-periphery/src (PR#406)
                └── Swaps
                      └── SwapVerifier.sol
```

1.3 Risk Assessment Framework

1.3.1 Severity Classification

Severity	Description	Potential Impact
Critical	Immediate threat to user funds or protocol integrity	Direct loss of funds, protocol compromise
High	Significant security risk requiring urgent attention	Potential fund loss, major functionality disruption
Medium	Important issue that should be addressed	Limited fund risk, functionality concerns
Low	Minor issue with minimal impact	Best practice violations, minor inefficiencies
Undetermined	Findings whose impact could not be fully assessed within the time constraints of the engagement. These issues may range from low to critical severity, and although their exact consequences remain uncertain, they present a sufficient potential risk to warrant attention and remediation.	Varies based on actual severity
Gas	Findings that can improve the gas efficiency of the contracts.	Increased transaction costs
Informational	Code quality and best practice recommendations	Reduced maintainability and readability

Table 1: severity classification

1.4 Key Findings

Breakdown of Finding Impacts

Impact Level	Count
Critical	0
High	0
Medium	0
Low	1
Informational	0

2.2 Audit Team

HHK, Panda

2.3 Audit Timeline

The audit was conducted from January 27 to 27, 2026.

2.4 Audit Resources

Code repositories and documentation

2.5 Critical Findings

None.

2.6 High Findings

None.

2.7 Medium Findings

None.

2.8 Low Findings

2.8.1 Early return on zero `amountMin` silently skips deposit/skim operations

Technical Details

In `verifyAmountMinAndDeposit` and `verifyAmountMinAndSkim`, an early return occurs when `amountMin == 0`:

- SwapVerifier.sol#L38
- SwapVerifier.sol#L55

```
if (amountMin == 0) return;
```

This silently skips the deposit/skim operation entirely without any revert or indication to the caller. While 99.9% of swaps will specify `amountMin > 0`, callers may not expect that passing 0 results in no deposit rather than a deposit with no slippage protection.

Impact

Low. Unexpected behavior where zero `amountMin` silently skips operations instead of performing them without slippage checks. Zero share errors would revert at the vault level anyway.

Recommendation

Remove the early return checks, allowing the vault to handle edge cases and revert if necessary.

Developer Response

Fixed in commit b6046f4.

2.9 Gas Savings Findings

None.

2.10 Informational Findings

None.

2.11 Final Remarks

The new verifyAmountMinAndDeposit() function follows the same pattern as the existing skim-based flow and is straightforward. No major issues were identified during the review. The early return on amountMin == 0 in verifyAmountMinAndSkim() and verifyAmountMinAndDeposit() were removed, addressing the main finding from the review.
